We're about to build the world *again.*

Cleaner energy can change how a building runs. It cannot undo the carbon already released to make it.

+55%

projected growth in global building floor area, 2022–2050.

Material choices made now will shape that world for decades.

ETC, Zero-Carbon Buildings (2025), pp. 7, 10 · UNEP (2026)

Generated illustration

Generated illustration

Build with material that grows and stores carbon.
Make places that become more alive with time.

The obstacle is production.

Natural forms vary. Living growth keeps changing.
A repeatable process has to adapt.

Different parts. One process to develop.

Bower One / digital component studies

Variability is the essence of nature and the enemy of industry;
Bower's bet is to make variability manufacturable.

Biological materials: UNEP, Building Materials and the Climate (2023). Carbon benefit depends on sourcing and the building's whole life; Bower's performance is not yet measured.

Plants make *space.*

Clay's drawing

Show how growth changes enclosure and the experience of being inside the Bower.

Space

Planting becomes part of the room.

Light

Growth changes the light we inhabit.

Time

A place that develops after installation.

Growth changes the *geometry.*

We want

A shaded place to sit.

→

We ask

Where would planting need to establish and reach?

→

We reconsider

Revisit support spacing and paths for growth.

Shaded room

Revisit support spacing and paths for growth.

Filtered light

Explore orientation and openings in the frame.

Seasonal enclosure

Allow for growth, clearance and access for tending.

Clay's drawing

Show the intended shade, then the structural decision it asks us to reconsider.

Proposed design relationships. Plant requirements and geometric responses need testing together.

Can we make it?
Can it grow?

Fabricatability

Can we make and assemble the form?

Daniel’s engine in development

Current geometry study ↗

Geometry

The designer weighs the trade-offs.

Plantability

Does the form support the intended growth?

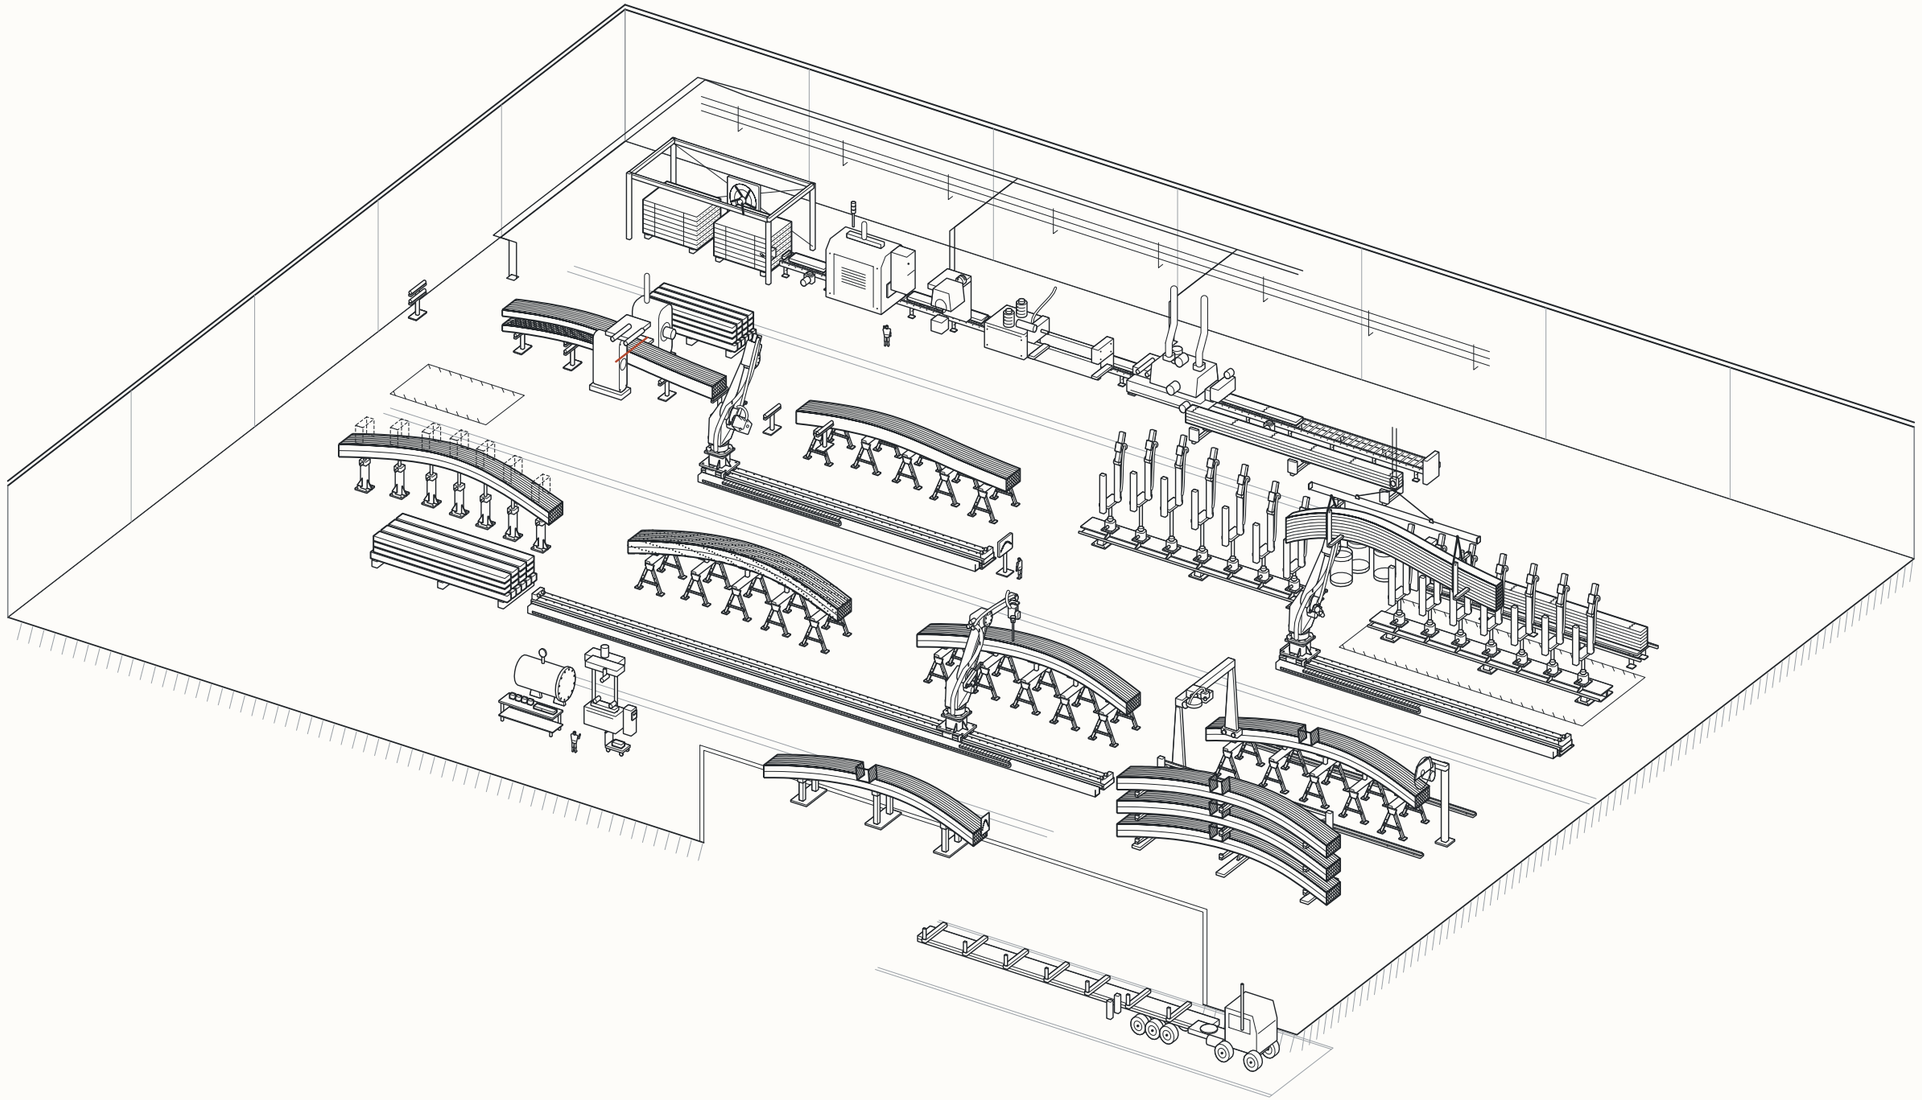

Proposed engine extension

Making informs geometry.
Forming, connections and assembly.

Growth informs geometry.
Reach, light and establishment.

Example design considerations. Plantability checks are proposed, not implemented or validated.

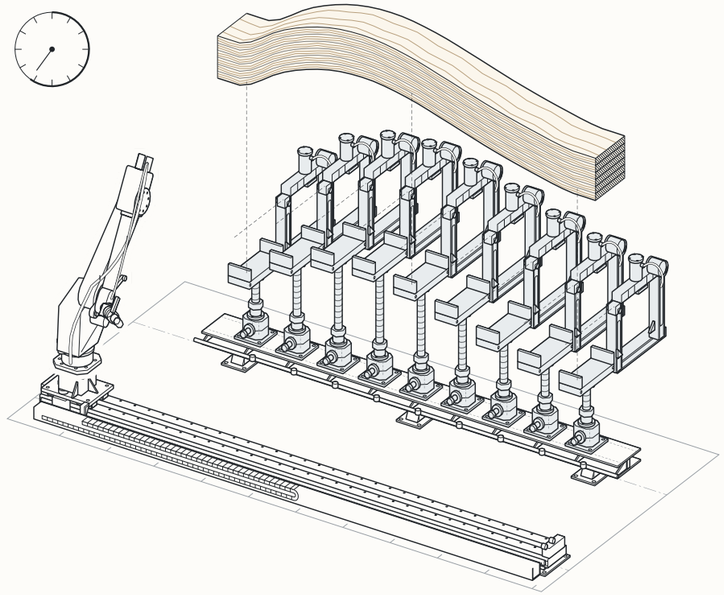

Different parts. A repeatable process.

Factory development study. Process arrangement, not a validated floor plan. Proposed line; performance and process assumptions require testing.

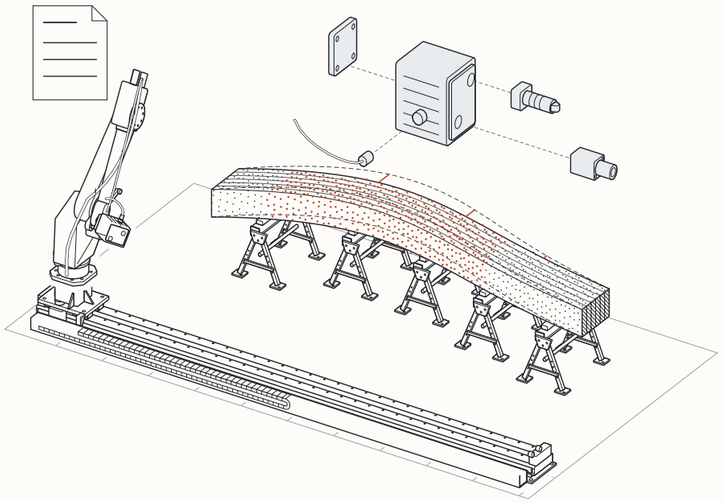

Form. Measure. Machine.

Form

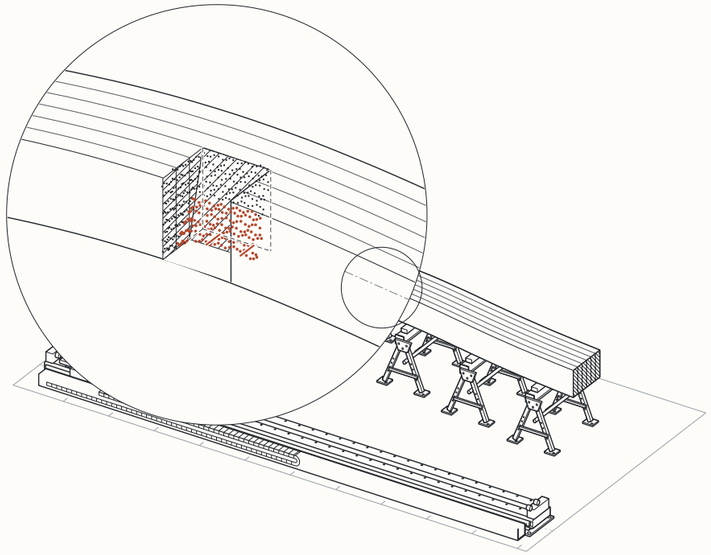

Robot-set pins guide the form.

Measure

A scan compares the rib with its target.

Machine

Joint geometry becomes a cutting sequence.

Factory development studies. Proposed process, not an operating line. Scan deviations are illustrative. Methods and assumptions in Drawing notes.

One learning system.

Making informs form.

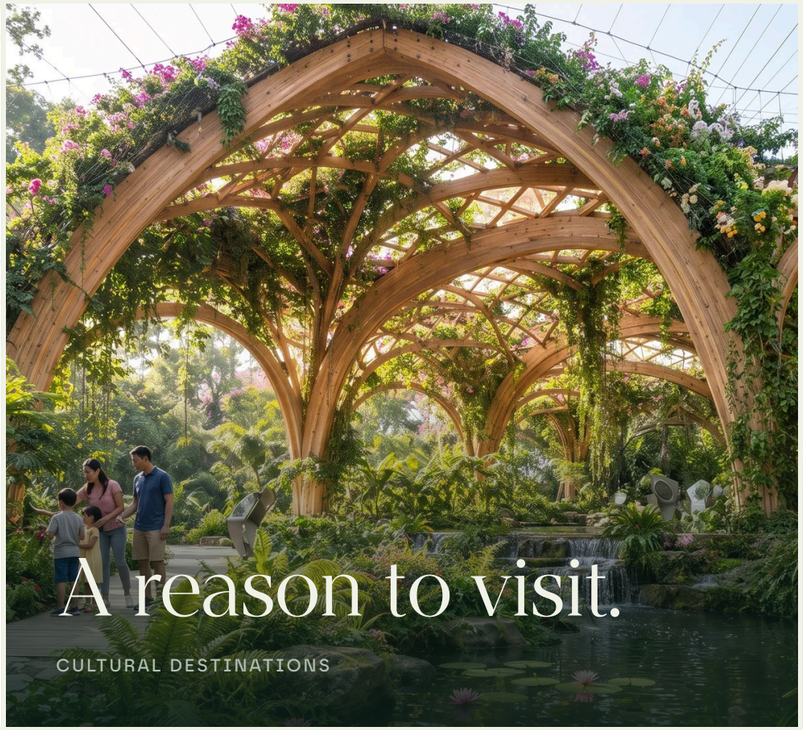

Plant behaviour informs form.

Observations improve the next design.

Intended integrated system. Biological checks and feedback from built Bowers remain to be developed and tested.

The first *customers.*

In discussion with

eden project

The Newt in Somerset

25h

Active conversations, not signed commissions. Images are Bower concepts, not work for these organisations.

Sell a Bower.
Develop the system.

Each early commission should create a place people want—and knowledge the next build can reuse.

Siting study

£65k

indicative

Design development

£100–250k

proposal-specific

Commissioned Bower

Build terms by contract.

Design and planting rules

Fabrication workflows

Evidence from living buildings

Intended commercial model / indicative proposal fees. Capability development and reinvestment depend on project economics and additional finance.

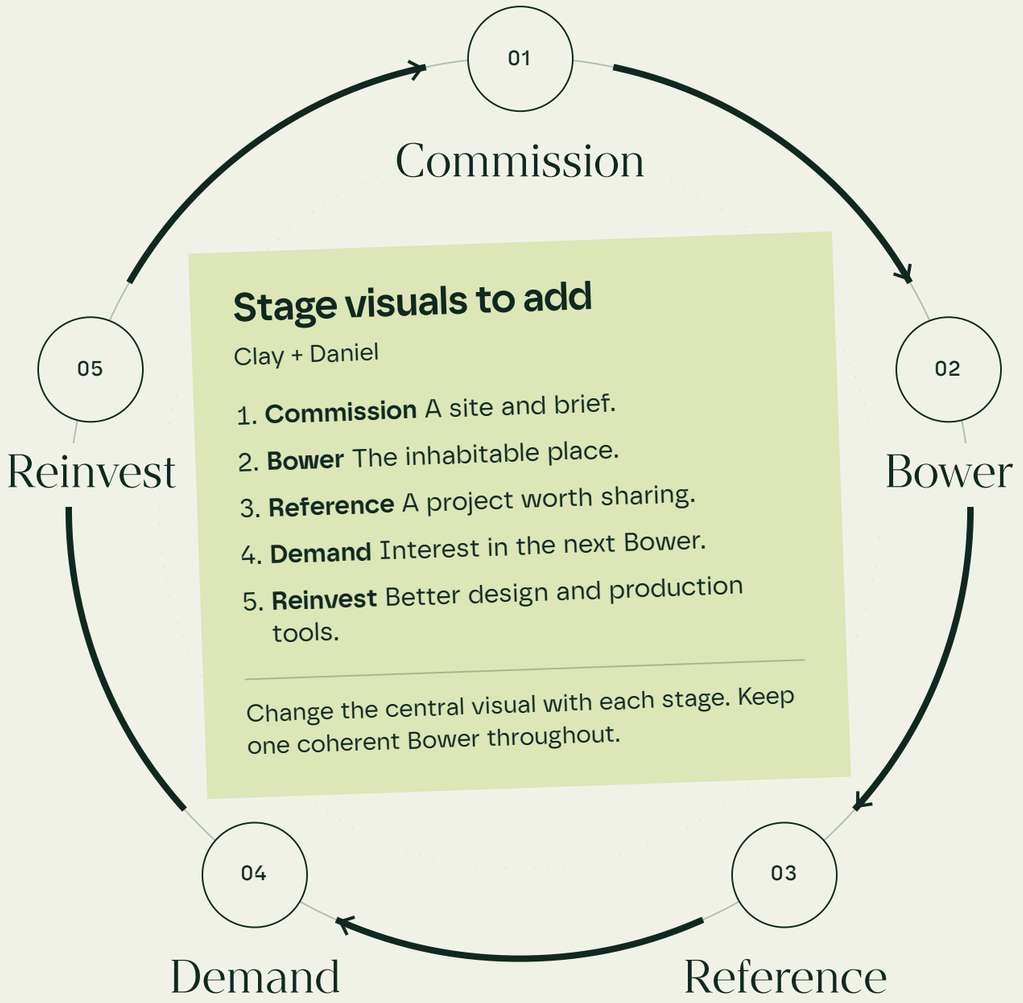

Built proof creates *demand.*

↻ THE NEXT CYCLE

The next place starts with more behind it.

Experience, references and stronger capability.

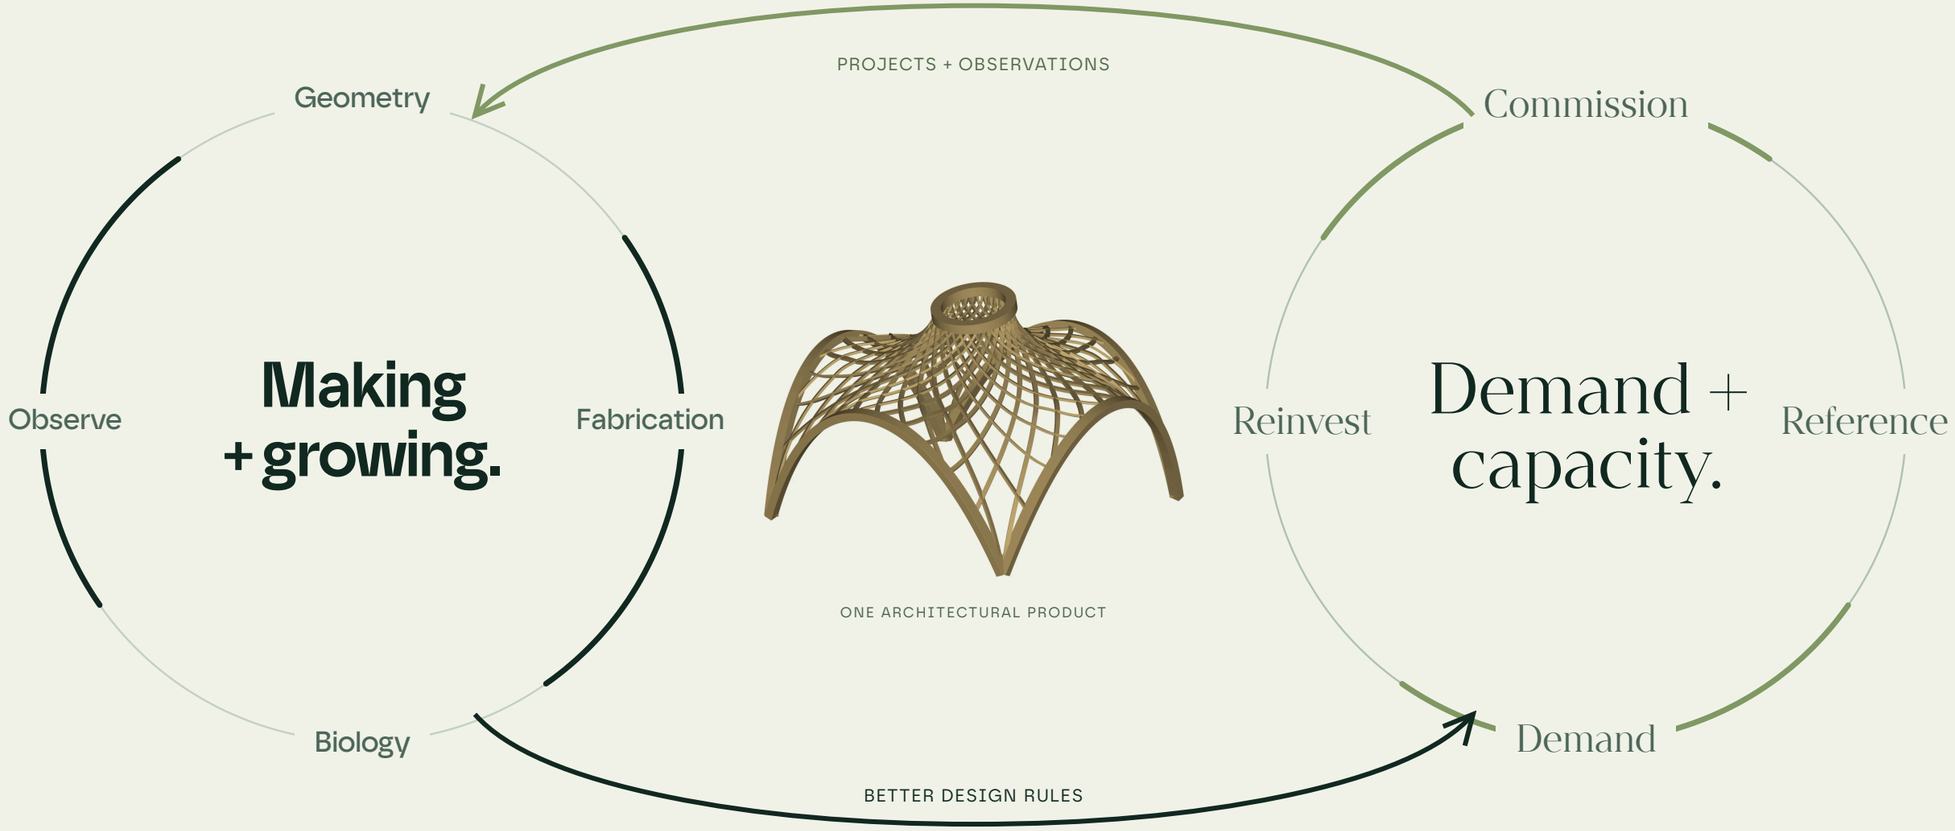

Commission → Bower → Reference → Demand → Reinvestment.

Intended commercial model. Reinvestment depends on project economics and finance.

Every Bower can teach *the next.*

The place, the making and the planting inform the next Bower.

Projects support learning. Learning improves projects.

Intended learning and commercial systems. Plantability rules require validation; further development depends on project economics and finance.

FIRST PRODUCT

LONG-TERM RESEARCH HORIZON

Long-term ambition. Speculative scale studies; engineering feasibility and lifecycle carbon performance remain to be demonstrated.

Buildings that *grow.*

Make the first Bower possible.
Develop the means to make many.

We mine, pour, and cut; we assemble inert objects that begin decaying the moment they're complete; and we've quietly accepted that the largest thing our species makes — the built world — is also the most severed from the living one.
